## ULTRAFRAGOLA MIRROR / LIGHT AND COLOR

Ultrafragola mirror is available in two versions: Neon and Led.

The Neon system consists of two L-shaped neon tubes and has a lifespan up to 15.000 hours.

The LED system consists of over 12 m of RGB strip diffused by opal plexiglas covers.

The lifespan of this system is greater than 25.000 hours.

The brightness of the systems is the same, while the color is slightly different due to the peculiarities of each technology. In the neon version (left) the pink is slightly warmer than the LED version (right).

Little tips: Both versions need a few minutes to go to full capacity, the neon mirror will light up slightly darker, on the contrary the LED will light up with a more pink color but in a few minutes it will return to its characteristic soft pink.

*\* The images shown are indicative, the color may be different. The images are intended to indicate the color difference between the two systems.*
